

GT74LVC8T245

8-Bit Dual-Supply Bus Transceiver with Voltage Translation

1 Features	2 Application
<ul style="list-style-type: none"> - Control inputs VIH/VIL levels are referenced to V_{CCA} - V_{CC} isolation feature – if either V_{CC} input is at GND, all are in the high-impedance state - Fully configurable dual-rail design allows each port to operate over the full 1.65V to 5.5V power supply range - Recommended temperature range: -40°C to +125°C - Max data rates 420 Mbps (3.3-V to 5-V Translation) 210 Mbps (Translate to 3.3V) 140 Mbps (Translate to 2.5V) 75 Mbps (Translate to 1.8V) 	<ul style="list-style-type: none"> - Personal electronic - Industrial - Enterprise - Telecom

3 Description	Circuit Diagram
<p>This 8-bit noninverting bus transceiver uses two separate power-supply rails. The GT74LVC8T245 is optimized to operate with V_{CCA} and V_{CCB} set at 1.65V to 5.5V. The A port is designed to track V_{CCA}. V_{CCA} accepts any supply Voltage from 1.65V to 5.5V. The B port is designed to track V_{CCB}. V_{CCB} accepts any supply Voltage from 1.65V to 5.5V. This allows for universal low-voltage bidirectional translation between any of the 1.8V, 2.5V, 3.3V, and 5.5V voltage nodes. The logic levels of the direction-control (DIR) input and the output-enable (OEB) input activate either the B-port outputs or the A-port outputs or place both output ports into the high-impedance mode. The device transmits data from the A bus to the B bus when the B-port outputs are activated, and from the B bus to the A bus when the A-port outputs are activated. The input circuitry on both A and B ports is always active and have a logic HIGH or LOW level applied to prevent excess I_{CC} and I_{CCZ}. The GT74LVC8T245 is designed so that the control pins are supplied by V_{CCA}.</p>	 <p>The circuit diagram illustrates the internal logic for the GT74LVC8T245. It shows the DIR and OEB inputs being processed through logic gates (inverters and AND gates) to control the A1 and B1 output buffers. The A1 buffer consists of two inverters, while the B1 buffer consists of three inverters. A feedback path from the outputs of the buffers provides feedback to the input stage. A bracket labeled "To seven other Channels" indicates that the same basic structure is replicated for all eight channels of the device.</p>

B7	15	I/O	Input/output B7. Referenced to VCCB.
B8	14	I/O	Input/output B8. Referenced to VCCB.
DIR	2	I	Direction-control signal.
GND	11,12,13	-	Ground
OEB	22	I	3-state output-mode enables. Pull OEB high to place all outputs in 3-state mode. Referenced to VCCA.
VCCA	1	-	A-port supply Voltage. $1.65V \leq VCCA \leq 5.5V$
VCCB	23,24	-	B-port supply Voltage. $1.65V \leq VCCB \leq 5.5V$

* All unused input pins cannot be suspended and suggested to connect to GND.

6 Voltage, Temperature, ESD and Thermal Ratings

6.1 Absolute Maximum Ratings⁽¹⁾

Parameters			MIN	MAX	UNIT
Supply voltage range, VCCA, VCCB			-0.5	6.5	V
VI	Input voltage range ⁽²⁾		I/O ports (A port)	-0.5	6.5
			I/O ports (B port)	-0.5	6.5
			Control inputs	-0.5	6.5
VO	Voltage range applied to any output in the high-impedance or power-off state ⁽²⁾		A port	-0.5	6.5
			B port	-0.5	6.5
VO	Voltage range applied to any output in the high or low state ⁽²⁾ ⁽³⁾		A port	-0.5	VCCA + 0.5
			B port	-0.5	VCCB + 0.5
I _{IK}	Input clamp current		VI < 0		-50 mA
I _{OK}	Output clamp current		VO < 0		-50 mA
I _O	Continuous output current			±50	mA
Continuous current through each VCCA, VCCB, and GND				±100	mA

(1)Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2)The input and output negative-voltage ratings may be exceeded if the input and output current ratings are observed.

(3)The output positive-voltage rating may be exceeded up to 6.5V maximum if the output current rating is observed.

6.2 ESD Ratings

ESD		Value	Unit
V(ESD)	Electrostatic discharge	Human-Body Model (HBM)	8 K
		Charged-Device Model(CDM)	2 K

(1)JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2)JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

Enable and Disable Times
Low-And High-Level Enabling

Notes:

- A.CL includes probe and jig capacitance.
- B.Waveform 1 is for an output with internal conditions such that the output is low, except when disabled by the output control. Waveform 2 is for an output with internal conditions such that the output is high, except when disabled by the output control.
- C.All input pulses are supplied by generators having the following characteristics: PRR ≤ 10 MHz, ZO=50 Ω, dv/dt ≥ 1 V/ns.
- D.The outputs are measured one at a time, with one transition per measurement.
- E.TPLZ and TPHZ are the same as tdis .
- F.TPZL and TPZH are the same as ten .
- G.TPLH and TPHL are the same as tpd .
- H.VCCI is the VCC associated with the input port.
- I.VCCO is the VCC associated with the output port.
- J.All parameters and waveforms are not applicable to all devices.

10 Detailed Description

The GT74LVC8T245 is an 8-bit, dual supply non-inverting Voltage level translation. Pin Ax and direction control pin are support by VCCA and pin Bx is support by VCCB. The A port is able to accept I/O Voltages ranging from 1.65V to 5.5V, while the B port can accept I/O Voltages from 1.65V to 5.5V. The high on DIR allows data transmission from A to B and a low on DIR allows data transmission from B to A. This device is fully specified for partial-power-down applications using I_{off} . The I_{off} circuitry disables the outputs, preventing damaging current backflow through the device when it is powered down.

The Vcc isolation feature ensures that if either Vcc input is at GND, all outputs are in the high-impedance state. To ensure the high-impedance state during power up or power down, OEB should be tied to Vcc through a pullup resistor; the minimum Value of the resistor is determined by the current-sinking capability of the driver.

The GT74LVC8T245 is a Voltage level translator that can operate from 1.65V to 5.5V (VCCA) and 1.65V to 5.5V (VCCB). The signal translation between 1.65V and 5.5V requires direction control and output enable control. When OEB is low and DIR is high, data transmission is from A to B. When OEB is low and DIR is low, data transmission is from B to A. When OEB is high, both output ports will be high-impedance.

Table.10-1. Function Table

Control Inputs		Output Circuits		Operation
OEB	DIR	A port	B port	
L	L	Enabled	Hi-Z	B TO A
L	H	Hi-Z	Enabled	A TO B
H	X	Hi-Z	Hi-Z	Isolation

11 Application Note

The GT74LVC8T245 device can be used in level-translation applications for interfacing devices or systems operating at different interface Voltages with one another. The maximum output current can be up to 32 mA when device is powered by 5V.

11.1 Typical Application

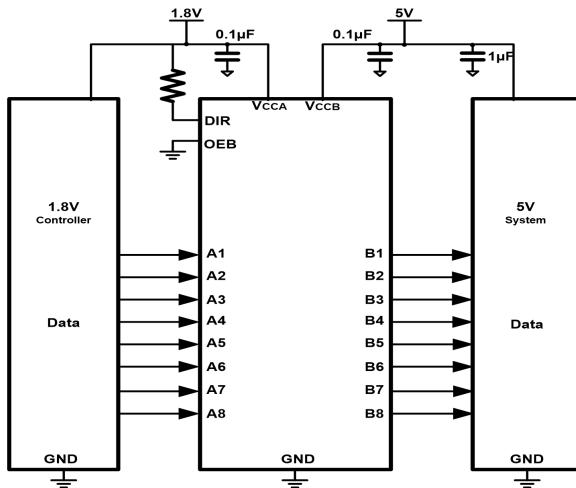

Fig.11-1. Typical Application Circuit

11.2 Enable Times

$$TPZH (\text{DIR to A}) = TPLZ (\text{DIR to B}) + TPLH (\text{B to A})$$

$$TPZL (\text{DIR to A}) = TPHZ (\text{DIR to B}) + TPHL (\text{B to A})$$

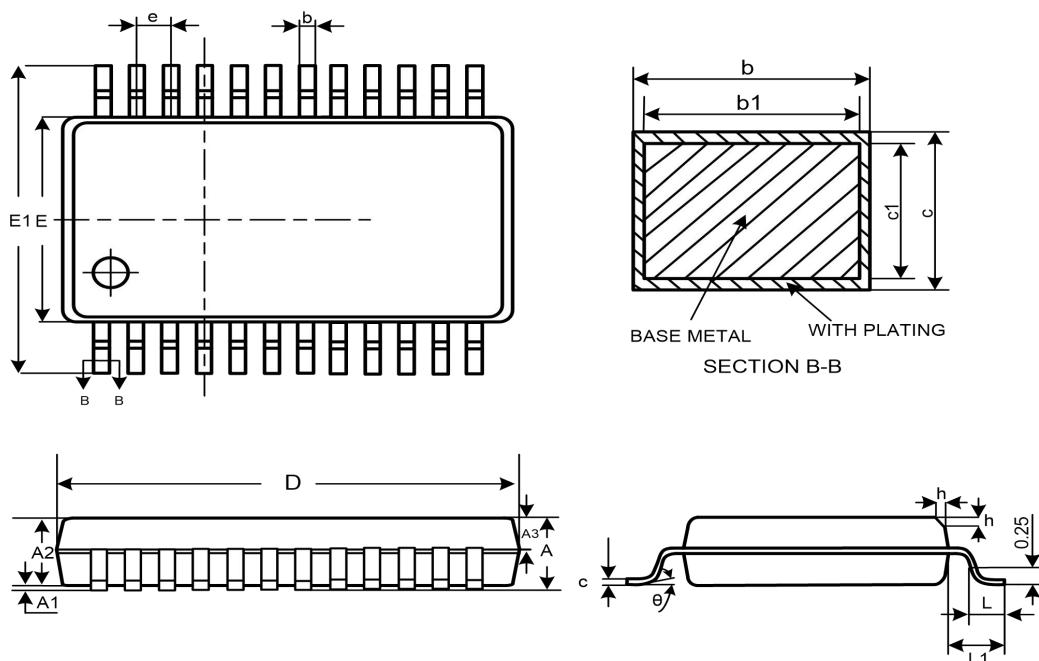

$$TPZH (\text{DIR to B}) = TPLZ (\text{DIR to A}) + TPLH (\text{A to B})$$

$$TPZL (\text{DIR to B}) = TPHZ (\text{DIR to A}) + TPHL (\text{A to B})$$

In a bidirectional application, these enable times provide the maximum delay from the time the DIR bit is switched until an output is expected. For example, if the GT74LVC8T245 initially is transmitting from A to B, then the DIR bit is switched; the B port of the device must be disabled before presenting it with an input. After the B port has been disabled, an input signal applied to it appears on the corresponding A port after the specified propagation delay.
