

GT321 GT358 GT324

High Voltage General Purpose Operational Amplifier

1 Features	2 Application
- Ultra-low input offset voltage: $\pm 3\text{mV}$ - Power supply voltage: $+3\text{V}$ to $+36\text{V}$ - Support single and dual power supply - Low quiescent current: $100\mu\text{A}/\text{channel}$ - Low wideband noise: $35\text{nV}/\sqrt{\text{Hz}}$ - Rail to Rail output - Unity-bandwidth gain: 1.5 MHz - Operating temperature range: -40°C to $+125^{\circ}\text{C}$	- Motordriver - Sensor module - Household appliances - Power supply module - Inverter - UPS - Air conditioning inside and outside - Automotive electronics

3 Description	Circuit Diagram
GT321,GT358,GT324 high-voltage general purpose operational amplifiers from GTIC is manufactured using advanced processes with full process standardization and control. The series includes single op-amp(GT321), dual op-amp(GT358), and quad op-amp(GT324), which feature unique circuit design techniques and classic rail-to-rail input/output swing. They exhibit high consistency and symmetry within the entire working voltage and temperature range, making them particularly suitable for applications that have high cost requirements and limited space, where the amplifiers can be well-coordinated and balanced with the overall circuit design. GT321,GT358,GT324 chips includes builtin over load protection circuits that allow the amplifier store cover from overloads and resume operation in a short amount of time, greatly enhancing the circuit's reliability.

V+	4	-	Positive (highest) power supply

* It is suggested to leave the unconnected pins floating.

6 Voltage, Temperature, ESD and Thermal Ratings

6.1 Absolute Maximum Ratings

Parameters ⁽¹⁾	Min.	Max.	Unit
Supply Voltage, $V_S=(V+) - (V-)$	0	40	V
Select Input Voltage ⁽²⁾	(V-)-0.3	(V+)+0.3	V
Maximum Junction Temperature	-45	160	°C
Storage Temperature Range	-65	150	°C

(1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those specified is not implied.

(2) Input terminals are diode-clamped to the power-supply rails. Input signals that can swing more than 0.3V beyond the supply rails should be current-limited to 10mA or less.

6.2 ESD Ratings

ESD			Value	Unit
V(ESD)	Electrostatic Discharge	Human-Body Model (HBM) ⁽¹⁾	3 K	V
		Charged-Device Model (CDM) ⁽²⁾	3 K	V

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

Over operating free-air temperature range (unless otherwise noted)

Symbol	Parameters	Min	Max	Unit
V_{CC}	Single-Supply, $V_S=(V+) - (V-)$	3	36	V
	Dual-Supply, $V_S=(V+) - (V-)$	±1.5	±18	V
TA	Operating Temperature	-40	125	°C

7 Electrical Specifications

$V_S=30V$, and $R_L=10k\Omega$ connected to $V_S/2$, and $V_{OUT}=V_S/2$. Typical values are at $T_A=+25^\circ C$. (unless otherwise noted)

Parameter	Symbol	Test Conditions	Min	Typ	Max	Units
Offset						
Input Offset Voltage	V_{OS}	$(V_S+)=15V$, $(V_S-)= -15V$	-3	± 0.35	3	mV
V_{OS} VS Temperature	dV_{OS}/dT	$V_S=30V$, $T_A=-40^\circ C$ to $125^\circ C$		± 2		$\mu V/^\circ C$
Power-Supply Rejection Ratio	PSRR	$V_S=30V$, $T_A=-40^\circ C$ to $125^\circ C$	70	100		dB
Power supply						
Power Supply	V_S	No load	3		36	V
Quiescent Current/Per	I_Q	No load		100	180	μA
Input						
Common Mode Voltage Range	V_{cm}		(V-)		(V+)-1.5	V
Common Mode Rejection Ratio	CMRR	$(V-) < V_{cm} < (V+) - 1.5$	65	120		dB
Differential	Input cap			7.7		pF
Common Mode	Input cap			9		pF
Input Bias Current	I_B	$T_A=-40^\circ C$ to $85^\circ C$		30		pA
Input Offset Current	I_{OS}			2		pA
Output						
Voltage Output Swing	V_O	$V_S=30V$, $I_{out}=-1mA$		0.5	1.5	V
Short Circuit Current	I_{SC}	$V_S=30V$		35		mA
AC						
Open Loop Voltage Gain	A_{OL}		85	100		dB
Slew Rate	SR	$V_S=-15V$, $V_S+=15V$, $AV=1$, $V_{out}=-1V$ to $1V$, $C_{load}=30pF$, $R_{load}=10k\Omega$		0.78		V/ μS
Gain-Bandwidth Product	GBW	$V_S=5V$		1.5		MHz
Gain Margin	GM			60		°
Phase Margin	PM			12		dB
Setting time, 0.1%	t_s	$V_S=-15V$, $V_S+=15V$, $AV=1$, 2-V step, $C_{load}=60pF$, $R_{load}=10k\Omega$				
Noise						
Total Harmonic Distortion+Noise	THD+N	$V_S=30V$, $AV=1$, $f=1KHz$, $R_{load}=10k\Omega$, $V_{out}=1V_{pp}$		0.002		%
Input Voltage Noise	E_N	$V_S=30V$, $f=0.1Hz$ to $10Hz$		2.9		μV_{rms}
Input Voltage Noise Density	e_N	$V_S=5V$, $f=1KHz$		35		nV/ $\sqrt{Hz}$
Input Current Noise Density	I_n	$V_S=5V$, $f=1KHz$		23		fA/ $\sqrt{Hz}$

8 Typical Characteristics

At $T_A=+25^{\circ}\text{C}$, $V_{CC}=30\text{V}$, $R_L=10\text{K}\Omega$ connected to $V_{CC}/2$, $V_{OUT}=V_{CC}/2$. (unless otherwise noted)

9 Detailed Description

These devices contain four independent high gain frequency compensation op amps designed for single supply over a wide voltage range. Dual-supply operation is also possible if the voltage difference between the two supplies is between 3V and 36V and V_{CC} is at least 1.5V higher than the positive value of the input common-mode voltage. The low supply current drain is independent of the magnitude of the supply voltage. Applications include sensor amplifiers, DC amplifiers, and all traditional op amp circuits, which can now be more easily implemented in single-supply voltage systems.

The valid common-mode range is from device ground to $V_{CC}-1.5V$ ($V_{CC}-2V$ over temperature). The input may exceed V_{CC} up to the maximum V_{CC} without damaging the device. At least one input must be within a valid input common-mode range for the output to have the correct phase. If both inputs are outside the valid range, the output phase is undefined. If either input is below -0.3V, the input current should be limited to 1mA and the output phase should be undefined.

Slew rate is the rate at which the op amp can change the output when the input changes. Slew rates are better for different occasions, sometimes bigger is better, sometimes smaller is better, GT321, GT358, GT324, these devices have a slew rate of 1.0 V/ μ S.

The gain-bandwidth product is equal to the measured amplifier bandwidth multiplied by the gain corresponding to the measured bandwidth. For op amps, the increase in bandwidth means an increase in speed, but at the same time it brings a large amount of power consumption, for general occasions, the bandwidth around 1MHz can take into account the balance of all aspects of the op amp parameters, these devices have a high gain bandwidth of 1.0MHz.

GT321, GT358, GT324 features a low input offset voltage as low as 0.35mV typical from a high voltage supply because the input offset voltage is amplified by noise gain, creating offset errors at the output. For a high-voltage general-purpose op amp, the application scenarios and scope of the op amp are maximized while minimizing the design of the low offset voltage while taking into account other op amp parameters. It is especially suitable for some occasions with high sensitivity.

10 Application Note

Op amps are suitable for a variety of signal conditioning applications. The input can be powered before V_s , allowing flexibility in multiple supply circuits. The amplifier accepts a positive voltage at the input and then changes the voltage to a negative voltage of the same magnitude. It also turns the negative input voltage into positive in the same way.
